Attempt : 1

Total Mark : 15

Marks Obtained : 14

Section 1 : MCQ

1. What will be the output of the following code?

```
class Box {  
    int length = 5;  
    int width = 4;  
  
    int area() {  
        return length * width;  
    }  
  
    public static void main(String[] args) {  
        Box b = new Box();  
        System.out.println("Area = " + b.area());  
    }  
}
```

Answer

Area = 20

Status : Correct

Marks : 1/1

2. What will be the output of the following code?

```
class Box {  
    int volume(int l, int b, int h) {  
        return l * b * h;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Box b = new Box();  
        System.out.println(b.volume(2, 3, 4));  
    }  
}
```

Answer

24

Status : Correct

Marks : 1/1

3. What will be the output of the following code?

```
class Sample {  
    int x = 10;  
  
    void display() {  
        System.out.println("x = " + x);  
    }  
  
    public static void main(String[] args) {  
        Sample s = new Sample();  
        s.display();  
    }  
}
```

}

Answer

x = 10

Status : Correct

Marks : 1/1

4. What will be the output of the following code?

```
class A {  
    int val = 20;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.val += 5;  
        System.out.println(obj1.val);  
    }  
}
```

Answer

25

Status : Correct

Marks : 1/1

5. What will be the output of the following code?

```
class A {  
    int x = 50;  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.x = 100;  
        System.out.println(obj1.x);  
    }  
}
```

```
}
```

Answer

100

Status : Correct

Marks : 1/1

6. What is the output of the following code?

```
class Box {  
    int height;  
    Box(int height) {  
        this.height = height;  
    }  
    void modifyHeight(Box b) {  
        b.height += 10;  
    }  
}  
public class Main {  
    public static void main(String[] args) {  
        Box b1 = new Box(20);  
        b1.modifyHeight(b1);  
        System.out.println(b1.height);  
    }  
}
```

Answer

30

Status : Correct

Marks : 1/1

7. What will be the output of the following code?

```
class Ball {  
    int size = 11;  
}
```

```
class Game {
```

```
public static void main(String[] args) {  
    Ball b1 = new Ball();  
    Ball b2 = new Ball();  
    b2.size = 10;  
    System.out.println(b1.size);  
}  
}
```

Answer

11

Status : Correct

Marks : 1/1

8. What will be the output of the following code?

```
class MathUtils {  
    int add(int x) {  
        return x + x;  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        MathUtils m = new MathUtils();  
        System.out.println(m.add(5));  
    }  
}
```

Answer

10

Status : Correct

Marks : 1/1

9. What will be the output of the following code?

```
class Alpha {  
    void greet(String name) {  
        System.out.println("Hello " + name);  
    }  
}
```

```
}

public class Main {
    public static void main(String[] args) {
        Alpha obj = new Alpha();
        obj.greet("Anu");
    }
}
```

Answer

Hello Anu

Status : Correct

Marks : 1/1

10. What will be the output of the following code?

```
class Person {
    String name;
    void setName(String n) {
        name = n;
    }
    void printName() {
        System.out.println(name);
    }
}

class Test {
    public static void main(String[] args) {
        Person p = new Person();
        p.printName();
    }
}
```

Answer

null

Status : Correct

Marks : 1/1

11. What will be the output of the following code?

```
class Demo {  
    void printMessage() {  
        System.out.println("Hello from Demo");  
    }  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Demo d = new Demo();  
        d.printMessage();  
    }  
}
```

Answer

Hello from Demo

Status : Correct

Marks : 1/1

12. What will be the output of the following code?

```
class Person {  
    int age = 18;  
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Person p = new Person();  
        p.age += 2;  
        System.out.println("Age: " + p.age);  
    }  
}
```

Answer

Age: 20

Status : Correct

Marks : 1/1

13. What will be the output of the following code?

```
241001203 class Test {  
241001203     private int value;  
241001203     Test(int value) {  
241001203         this.value = value;  
241001203     }  
241001203     public int getValue() {  
241001203         return value;  
241001203     }  
241001203 }  
241001203 public class Main {  
241001203     public static void main(String[] args) {  
241001203         Test obj = new Test(10);  
241001203         System.out.println(obj.value);  
241001203     }  
241001203 }
```

Answer

10

Status : Wrong

Marks : 0/1

14. What will be the output of the following code?

```
241001203 class A {  
241001203     int y = 30;  
241001203 }  
241001203 public class Main {  
241001203     public static void main(String[] args) {  
241001203         A a1 = new A();  
241001203         A a2 = new A();  
241001203         a1.y = 50;  
241001203         System.out.println(a2.y);  
241001203     }  
241001203 }
```

Answer

30

Status : Correct

Marks : 1/1

15. What will be the output of the following code?

```
class A {  
    int p = 5;  
    int q = 2;  
}  
  
class Main {  
    public static void main(String[] args) {  
        A obj = new A();  
        System.out.println(obj.p + obj.q);  
    }  
}
```

Section 1 : Coding

1. Problem Statement

You are working as a developer for CityBank, which wants to build a basic account management system.

Each customer at the bank has:

An Account Number (integer)
A Customer Name (string)
An Initial Balance (double)

The bank allows two types of transactions:

Deposit – increases the balance.
Withdrawal – decreases the balance only if enough funds are available.

If the withdrawal amount is greater than the balance, the withdrawal should not happen, and the balance should remain the same.

You are required to implement this system using:

A class with attributes for account details. A constructor to initialize account details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's account details after all transactions.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the account number (integer).
- The following line contains the customer name (string).
- The next line contains the initial balance (double).
- The next line contains the deposit amount (double).
- The next line contains the withdrawal amount (double).

Output Format

For each customer, print the details in the following format:

1. Account Number: <account_number>
2. Customer Name: <customer_name>
3. Final Balance: <final_balance> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Rahul Sharma

5000

2000

3000

Output: Account Number: 1234

Customer Name: Rahul Sharma

Final Balance: 4000.0

Answer

```
import java.util.Scanner;

class BankAccount {
    private int accountNumber;
    private String customerName;
    private double balance;

    // Constructor
    public BankAccount(int accountNumber, String customerName, double
balance) {
        this.accountNumber = accountNumber;
        this.customerName = customerName;
        this.balance = balance;
    }

    // Getter and Setter methods
    public int getAccountNumber() {
        return accountNumber;
    }

    public void setAccountNumber(int accountNumber) {
        this.accountNumber = accountNumber;
    }

    public String getCustomerName() {
        return customerName;
    }

    public void setCustomerName(String customerName) {
        this.customerName = customerName;
    }

    public double getBalance() {
        return balance;
    }

    public void setBalance(double balance) {
        this.balance = balance;
    }
}
```

```
// Deposit method
public void deposit(double amount) {
    if (amount >= 0) {
        balance += amount;
    }
}

// Withdrawal method
public void withdraw(double amount) {
    if (amount <= balance) {
        balance -= amount;
    }
    // If withdrawal amount > balance, do nothing
}
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int N = Integer.parseInt(sc.nextLine().trim());

        for (int i = 0; i < N; i++) {
            int accountNumber = Integer.parseInt(sc.nextLine().trim());
            String customerName = sc.nextLine().trim();
            double initialBalance = Double.parseDouble(sc.nextLine().trim());
            double depositAmount = Double.parseDouble(sc.nextLine().trim());
            double withdrawalAmount = Double.parseDouble(sc.nextLine().trim());

            // Create BankAccount object
            BankAccount account = new BankAccount(accountNumber,
customerName, initialBalance);

            // Perform transactions
            account.deposit(depositAmount);
            account.withdraw(withdrawalAmount);

            // Print final account details
            System.out.println("Account Number: " + account.getAccountNumber());
            System.out.println("Customer Name: " + account.getCustomerName());
            System.out.println("Final Balance: " + String.format("%.1f",
account.getBalance()));
        }
    }
}
```

```
    }  
    sc.close();  
}
```

1. Problem Statement

Neha is working as a developer for CityElectricity Board, which wants to build a household electricity billing system.

Each customer's electricity account has:

A Customer ID (integer) A Customer Name (string) Units Consumed (double)

The electricity bill is calculated based on these rules:

For the first 100 units 5 units charge per unit
For the next 100 units (101–200) 7 units charge per unit
For units above 200 10 units charge per unit
If the total bill exceeds 2000 units, a 5% discount is applied on the final bill.

Neha has been asked to implement this system using:

A class with attributes for customer details.A constructor to initialize customer details.Setter methods to update details if needed.Getter methods to retrieve details.Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Units Consumed (double).

Output Format

For each customer, print the details in the following format:

Customer ID: <customer_id>

Customer Name: <customer_name>

Final Bill: <final_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

1. Problem Statement

You are working as a developer for CityCab, a taxi service company that wants to build a ride fare management system.

Each customer booking has:

A Booking ID (integer)
A Customer Name (string)
A Distance Travelled in km (double)

The fare calculation rules are:

Base Fare = 50 units (flat charge for every ride). Per km charge = 10 units/km. If the distance is greater than 20 km, a 10% discount is applied on the total fare.

You are required to implement this system using:

A class with attributes for booking details. A constructor to initialize booking details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customer rides.

Finally, display each booking's details and final fare.

Input Format

The first line of input contains an integer N, representing the number of bookings.

For each booking:

- The next line contains the booking ID (integer).
- The following line contains the customer's name (string).
- The next line contains the distance travelled (double).

Output Format

For each booking, print the details in the following format:

1. Booking ID: <booking_id>
2. Customer Name: <customer_name>
3. Final Fare: <final_fare> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Rahul Sharma

15

Output: Booking ID: 1234

Customer Name: Rahul Sharma

Final Fare: 200.0

Answer

```
import java.util.Scanner;
class Booking {

1. Problem Statement

Ram is working as a developer for BrightEdu Coaching Center, which wants to build a student fee management system.

Each student's enrollment has:

An Enrollment ID (integer) A Student Name (string) The Number of Subjects (integer)

The fee calculation rules are:

Registration Fee = 1000 units (flat for every student). Per Subject Fee = 800 units. If the student enrolls in more than 5 subjects, a 20% scholarship (discount) is applied on the total fee.

Ram has been asked to implement this system using:

A class with attributes for student details. A constructor to initialize student details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent student enrollments.

Finally, display each student's details and final fee.

Input Format

The first line of input contains an integer N, representing the number of students.

For each student:

- The next line contains the Enrollment ID (integer).
- The following line contains the student's name (string).
- The next line contains the Number of subjects (integer).

Output Format

For each student, print the details in the following format:

- Enrollment ID: <enrollment_id>
- Student Name: <student_name>
- Final Fee: <final_fee> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Ravi Kumar

3

Output: Enrollment ID: 1234

Student Name: Ravi Kumar

Final Fee: 3400.0

Answer

```
import java.util.*;
```

```
class Student {  
    private int id;
```

```
private String name;
private int numSubjects;

public Student(int id, String name, int numSubjects) {
    this.id = id;
    this.name = name;
    this.numSubjects = numSubjects;
}

public int getid() {
    return id;
}

public void setid(int id) {
    this.id = id;
}

public String getname() {
    return name;
}

public void setname(String name) {
    this.name = name;
}

public int getnumSubjects() {
    return numSubjects;
}

public void setnumSubjects(int numSubjects) {
    this.numSubjects = numSubjects;
}

public double calculatefee() {
    double Registerfee = 1000;
    double subjectfee = 800;
    double fee = Registerfee + (numSubjects * subjectfee);
    if (numSubjects > 5) {
        fee = fee - (fee*20/100);
    }
    return fee;
}
```

```
}

class Main {
    public static void main(String args[]) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine().trim());
        for (int i = 0; i < n; i++) {
            int id = Integer.parseInt(sc.nextLine().trim());
            String name = sc.nextLine();
            int numSubjects = Integer.parseInt(sc.nextLine().trim());

            Student school = new Student(id, name, numSubjects);

            System.out.println("Enrollment ID: " + school.getid());
            System.out.println("Student Name: " + school.getname());
            System.out.printf("Final fee: %.1f", school.calculatefee());
        }
        sc.close();
    }
}
```

Status : Correct
